Abstract

Occupational and educational decision is one of the issues faces by the young generation. The vocational interest and occupational congruency is one of the factor that influence individual in the career decision. Holland's Theory is one of the career theory that helps individual in understanding their own career personality and later helps them in career decision making. This study is aimed at determining the relationship between Holland's Theory and career decision making, and to identify the factors that affect career decision making. Scopus and Science Direct databases were searched to identify articles published between 2010 and 2018 which hit the keywords of 'Holland theory', 'career' and 'education decision'. A total of 20 journal articles were selected after inclusion and exclusion criteria runs. 70% of the research found that vocational personality types need to have high congruency with the working and study environment. It will help increase the performance. The factors that contributed to career decisions are career education, financial stress, parental support, gender, culture and job lose or live event. Holland theory makes a big contribution to the career and education decision making and helping in improving career satisfaction

Keywords: Holland theory, career decision making, career choice

INTRODUCTION

Holland Theory which introduced by John Holland helps individual to identify their career personality, vocation interest and the job personality. It proposed in 1959, where it was first conceptualized as a trait and factor theory [1] and later Holland's theory is been categorizes as the most practical and widely researched career theories [2]. This is because the theory is simple and uncomplicated. Holland also produce many assessment based on his theory in his practical. Many type of research been done by Holland including gender different and culture different [1].

According to Holland's theory, the individual career satisfaction is based on the fit or congruence between the career personality and the environment of the work, which known as person-environmental fit (PE fit). PE fit exist based on the congruence between the individual characteristics and the environmental where they wish to be in or work as [3]. From the past

researches showed that, the level of congruence between the individual and the working environmental is the main criteria to determine the individual performance [3].

Holland had discussed in his theory about individual and the environmental characteristic is characterized into six types of personality which are Realistic, Investigative, Artistic, Social, Enterprising and Conventional (RIASEC). RIASEC is formed based on the typology theory where it reflects on the interests and abilities of an individual and the environment [2].

According to Super, career is a way to making a living of an individual. [4]. In career counselling, the word of career has much more wide meaning [5] such as process of learning, life role of an individual or it could be working experiences. Other than that, career is a consistently changing procedure of arranging that involving planning of life, interests and abilities of an individual, attitude, financial matters and decision making skill of a person [5].

Decision-making is when an individual gauging the clear result against dangers and illuminating the associations with individual needs and values and detailing an arrangement of activity [5]. Knowledge and skills is the main factor of making a good decision. By making a good decision individual can control the path their want to go and not leaving the future to determine by the fate [5].

Holland explains that the satisfactory of a decision making in career or education, is depending on how the personality and the working environment match (PE fit). Holland state that, the higher the congruent between the personality and work environment, the happier the individual will do [5]. Therefore, is Holland Theory being as effective as mentioned in books? There is a need to see the effectiveness of this ideal theory in the real practice.

Objectives

The objectives of this review are as follows:

1. *What are the relationship between Holland theory and career decision making?*

This question is targeting to find out the relationship between Holland theory and career decision making. The result and data collected by others researchers are reviewed to determine how well the relationship between Holland theory and career decision making is.

2. *What are the factors that could affect career decision making?*

The focus is on the factors that affecting the decision making of an individual. What are the main factor make an individual get into the low satisfactory for the decision in the career and education path.

METHODOLOGY

This systematic review is start with using few key words as the first step. The area of interest which is Holland theory and career and education decision making were taken as the key word. To get quality and relevant literatures or journal articles, a specific search strategy is used in this review.

The Search Strategy

The strategy for this review is done by using a few subscribe databases to search the literatures or journals. Scopus and Sciences Direct databases were used to identify the relevant literatures. Holland theory, career and education decision making used as the key word to search the list of literatures or journal in the database. To get relevant literatures, few inclusion and exclusion criterion were being used in the searching process as in Table 1 and Table 2.

Inclusion criteria

The year of the articles published was the first inclusion criteria. The previous six year journals been chosen due to the topic is not so famous in the latest research, to get more resources. So 2013 to 2018 is set for the year of the literatures retrieved in order to get the latest information or data. English language is

the only language chosen as another inclusion criterion. Then, Psychology, social sciences, art and humanities, computer sciences and business, management and accounting, are chosen as the main area of subject in the searching tool. Journal article or research paper is been chosen as the type of paper in the searching of the relevant article. While, book chapter, article in press, review, book, conference paper and letter choose as the exclusion title in the search. Lastly is only quantitative research will be use in this review, qualitative research article will be excluded. This is because this review is a quantitative synthesis review, only quantitative article will be chosen for review.

In the initial searching, the number of journal or literatures search by using key word is high. The numbers were decrease when reviewer implied the inclusive and exclusive criteria. The searching was stop after 20 relevant and quality journal were identified. The information was filter out in the table after studied and review by reviewer. Figure 1 showed below is the basic information of the entire journal article. Figure 1 was the flow of searching journal article from starting until get all 20 relevant journal articles. Figure 1 shown a clearer picture of how systematic review search were done by using PRISMA figure, it will make reader to have a better understanding on how the journal or literatures were chosen.

There were 23023 relevant journal articles by using career and education decision making as key word. The number was decrease to 640 after adding Holland theory as the second key words. The years were limited to 2013 to 2014. Then, 189 journals were left. The research were then narrowed to English language only where left 184 journal are relevant to the topic of review Then, 162 journal were selected from the journal article type were is a article. All the inclusive criteria were listed in the Table 1 below.

Exclusion Criteria

This review excluded 32 non-relevant area articles. 140 articles are left after the exclusive. Articles then were selected from the area of psychology, social sciences, art and humanities, computer sciences and business, management and accounting. Then, full-text articles accessed for eligibility. 30 articles fulfilled all the selected area. Lastly the non-quantitative research or article were excluded due to the review is a quantitative synthesis systematic review. As in Figure 1, there are 18 journal articles and two additional journal source were selected for this systematic review.

For reader to understand more detail about how the process of the selection of the relevant journal article. Reviewers arrange and create a table for reader to know the detail. PRISMA figure used at below. A flow diagram for selection review of studies on the effectiveness of Holland on career and education decision-making were build. In Table 3, the number of selected journal and excluded criteria will be showed. Other than that, the step use also shown in Figure 1.

Table 1: Inclusion criteria of the systematic review

Inclusion Criteria presented in order	Particulars	Articles identified	Remaining articles
<i>Key term</i>	Career and education decision making	23032	23032
Second key term	Holland theory	640	640
<i>Year</i>	2013 to 2018	189	189
<i>Language</i>	English	184	184
<i>Journal type</i>		162	162

Table 2: Exclusion criteria of the systematic review

Exclusion Criteria presented in order	Particular	Articles identified	Remaining Articles
Subject area	Non-relevant area	32	140
Key word	No full key word	90	30
Research type	Non-quantitative research	10	20

FINDINGS OF LITERATURE REVIEW

Table 4 showed below is the summarizing of the effectiveness of Holland theory on career and education decision making. From the result, we can see that the vocational of personality of

the individual is affecting the career and education decision making. Most of the researcher found out that Holland theory need to be used before the individual enter the study or working field. Besides, there are other factors that affect decision-making.

Table 4: Statistical data from selected journal

Article Number	Number of participant	Statistical data/ Findings
1	4605 young adolescents	72.3% adolescents have significant result on career development skills and school success after attending the intervention class.
2	6062 employee in college athletics	50% of the sport occupation is dominated by Social types where is the most suitable for sport environment.
3	400 freshmen	Female will have higher chance to enter field of social while male is more to investigative field.
4	104 graduate students in counselling field	97.14% of counselling school students, 89.19% mental health students and 68.75% psychology school students ranked social types as their first type's personality.
5	99 undergraduate students	Student-major congruence and academic major satisfaction were both significant predictors of grade point average.
6	1144 students and working adults	calculus hypothesis (i.e., circular order model) was supported (correspondence index = .85, $p = .02$), while the hexagonal hypothesis (i.e., circumplex model) was partially supported with $\frac{3}{4}$ forms fit our validation sample
7	510 working adults	Characteristically dislike will be important to understanding job satisfaction.
8	1000 participants	Interest of individual show positive relationship with job consistency but other factor is also have positive significant with job consistency.
9	258 participants	Interest is positively related with occupation stability.
10	210 students	100% respondent interest with IT occupation and only 42 % have second interest occupation other than IT occupation.
11	272 participants	Vocational aspirations are indirectly affecting the person-vocation fit with a broad range of job-related criteria.
12	599 adolescents and adults	Six vocational personality types in two-dimensional space indicated slight disordering of the types in the Eastern Africa region and the correct ordering of the types in the Southern and Western African regions.
13	77 participant	A profiling procedure indicated that clients reported more occupational dislikes rather than likes.
14	28 university students	The total effects of both interest-major congruence and motivation on timely degree completion underscore the importance of both constructs in understanding student adjustment and postsecondary success.
15	300 freshmen	I-M fit predicts greater proportions of variance in major change intention; D-A fit predicts greater proportions of variance in academic performance; and N-S fit predicts greater proportions of variance in well-being

16	2,745 respondents	Males with a strong social personality also tended not to choose STEM majors (odd ratio = 0.9, $p = .02$), though social personality had a positive effect on whether females chose STEM majors (odds ratio = 1.29, $p = 0.05$).
17	326 German university students	Zero-order correlations, multiple regression analyses, and relative weight analyses identified perceived I-M fit as the key predictor of academic satisfaction and major change intention. D-A fit was the strongest predictor of academic performance.
18	477 students	Combination of interest, perceived competence, and prestige produced the best prediction of students' educational orientation. (67.5% and 63.7% for Holland code and 4 type model.)
19	1,044 college students	32% of the report interest congruence does not affect with major satisfaction.
20	346 college students	Personality characteristics, mental abilities, and congruence produced a multiple correlation of .26 ($R^2 = .07$) with satisfaction with major and a multiple correlation of .25 ($R^2 = .06$) with academic major change.

Table 5 below showed the summaries of the 20 selected literatures. The information is categorized into five items. The five items are author, year, and title of journal, country and relevant findings.

Table 5: Summary of Selection Literatures

Author & Year	Title of Journal	Country	Relevant Findings
Choi, Kim, & Kim, (2015)	Career Development and School Success in Adolescents: The Role of Career Interventions	Korea	Results support the influence of career education interventions on students' career development skills and school success
Pierce & Johnson (2017)	Applying Holland's Vocational Choice Theory in Sport Management	USA	The sport industry is dominated by the Social environment, evidenced by seven occupations possessing Social in the first letter of the profile and Social rating in the top two for all occupations. Seven occupations were primarily Social, three were Realistic, two were Enterprising, and two were Conventional
Johnson & Muse, (2016)	Choice of Academic Major at a Public Research University: The Role of Gender and Self-Efficacy	USA	Passing grades in calculus, quantitative test scores, and years of mathematics in high school are positively associated with choice of engineering fields.
Ding, Salyers, Kozelka, & Laux, (2015)	Vocational personality traits in counsellor education and school psychology students	USA	Student group with the highest degree of congruence, defined as the degree of fit between one's personality and the environment, had the highest graduate grade point average, indicating the relationship between the degree of congruence and achievement.
Milsom & Coughlin, (2017)	Examining Person-Environment Fit and Academic Major Satisfaction	USA	Student major congruence and academic major satisfaction were both significant predictors of grade point average.
Yang, Morris, & Protolipac, (2018)	Simplified Chinese version of the Strong Interest Inventory®: Structure and psychometric properties	China	Holland theory instrument is a good vocational interest tool for career counsellors working in China.

Phan & Rounds, (2017)	Examining the duality of Holland's RIASEC types: Implications for measurement and congruence	China	Examining what people characteristically dislike (find boring) might be important to understanding job satisfaction.
Schultz, Connolly, Garrison, Leveille, & Jackson, (2017)	Vocational Interests Across 20 Years of Adulthood: Stability, Change, and the Role of Work Experiences	USA	Individual differences in change indicated that not everyone changed in the same manner, with occupational experiences, such as job loss, related to greater change.
Tracey, Wille, Durr II, & Fruyt, (2014)	An enhanced examination of Holland's consistency and differentiation hypotheses	USA	The cosine fit indices of consistency and differentiation related to both occupational stability and career satisfaction.
Young, Carpenter, & Maasberg, (2016)	An Examination of Factors That Influence Students' IT Career Decisions	USA	Career optimism and career planning ability are important antecedents of students' IT career commitment, which significantly influences satisfaction with academic major. Occupational congruence found to be a poor predictor of academic major satisfaction and performance.
Marcus & Wagner, (2015)	What Do You Want To Be? Criterion-Related Validity of Attained Vocational Aspirations Versus Inventoried Person-Vocation Fit	Germany	Attainment of aspirations accounted for incremental variance in five out of six criteria beyond inventoried person-vocation fit, regardless of whether fit measures were based on ratings of interests and environment obtained from the same or from different sources.
Morgan & de Bruin, (2017)	Structural Validity of Holland's Circumplex Model of Vocational Personality Types in Africa	Africa	Inspection of the angular locations of the six vocational personality types in two-dimensional space indicated slight disordering of the types in the Eastern Africa region and the correct ordering of the types in the Southern and Western African regions.
Athanasou, (2018)	Vocational Interests and Job Choices Following an Acquired Disability: Results and Implications of an Idiographic Study	Australia	Six vocational interest types is not really as good as an effective tool for determined occupational choice following an injury. Instead, occupational dislikes may provide more useful data for vocational counselling.
Allen & Robbins, (2010)	Effects of Interest-Major Congruence, Motivation, and Academic Performance on Timely Degree Attainment	USA	Interest-major congruence and motivation on timely degree completion was the main item for the understanding of student adjustment and their academic success in the future.
Li, Yao, Chen, & Wang, (2012)	Different Fit Perceptions in an Academic Environment: Attitudinal and Behavioral Outcomes	China	Interest - major fit is the best for determine intention of major change, while D-A fit is for academic performance and lastly N-S fit is proportions of variance in well-being.
Chen & Simpson, (2015)	Does Personality Matter? Applying Holland's Typology to Analyze Students' Self-Selection into Science, Technology, Engineering, and Mathematics Majors	USA	Personality have strong related with the gender on choosing the STEM major.
Etzel & Nagy, (2015)	Students' Perceptions of Person-Environment Fit: Do Fit Perceptions Predict Academic Success Beyond Personality Traits?	Germany	I-M fit as the key predictor of academic satisfaction and major change intention. D-A fit was the strongest predictor of academic performance.

Leung, et al., (2014)	The use of interest and competence scores to predict educational choices of Chinese high school students	Hong Kong	Interest and competence scores of the PGI based on both the Holland RIASEC model can be used for determined the student education orientation group.
(Bai & Liao , 2018)	The Relation Between Interest Congruence and College Major Satisfaction: Evidence From the Basic Interest Measures	China	Strong congruence of the P-E fit will have related with the career-related satisfaction but not the satisfaction on academic major.
Pozzebon, Ashton, & Visser, (2014)	Major Changes: Personality, Ability, and Congruence in the Prediction of Academic Outcomes	Canada	Congruence of the vocational interest and academic major can link with the satisfaction but is not a necessarily for student to follow.

DISCUSSIONS

This review is looking on the effectiveness of Holland theory on career and education decision making. After reviewing the 20 selected articles, it shows that Holland theory has very high relationship with career decision making. The factors that affect career decision making or satisfaction are also discussed.

Relationship of Holland theory and career decision making

(PE fit)

There are few researches mentioned that the RIASEC model introduce in Holland theory affecting the career decision and career development. The code retrieve from the Holland inventories helps individual or students to determine their career and educational path. Person and environment fit is very important for the individual who finding job and students. According to Leung, et al. (2014), Holland theory and the RIASEC model produced useful information where it help individual to understand more about themselves. Besides it helps individual in making choices [6]. This finding is supported by Choi, Kim, and Kim (2015), where it showed that there is correlation between career guidance and student interest. The information giving by the career education helped students to discover their future career paths for them to choose. It can motivate students in career development and has positive impact on the academic achievement [7].

Ding, Salyers, Kozelka, and Laux (2015), research found out that the higher the degree of correlation between the student and environment which later contribute to the highest cumulative grade point average. This finding had also found in Marcus & Wagner (2015) research. Individual who is congruent between their vocational choice and initial aspiration will get good result on the self-report and supervisor-rated job performance. It will also reduce the counter-productive behavior and help individual to experiences high level of job satisfaction [8]. Student who are satisfied with their major will put more effort in their work. It will increase their academic performance than those who dissatisfied with their major course [2]. The lack of congruent with the major and the interest of student will create the boredom [9]. It caused students either avoid to study or lack of motivation to continue study.

Besides, Holland code from the RIASEC is considered as a part of self-awareness an individual. Holland code helps individual to explore the types of career and it easier and boarder the career planning [3]. However, the working environment does not need to be fully congruent with the student's personality types. Student should be consider all three-combination Holland code that they get from the Holland inventories. Congruent is one of the main source for individual to consider when matching the working or study environment but not the only source should an individual to look out when making

career choices [3]. The important suggestion found in one research is individual will need to know what are the work outcome as well. It will help individual to reduce the bored feeling [9]. Students are less likely to change their major when they know themselves well. Research showed that, greater interest-major congruence would lead student to enthuse about their coursework. This will create good outcome where they can graduate faster from their academic [10].

Another research were about the consistency of the first Holland code affecting the career. According to RIASEC model, consistency is reflects the degree of relatedness among an individual's or environment's profile of RIASEC scores. According to Tracey, Wille, Durr II, & Fruyt (2014), individual consistency is hypothesized to relate to persistence and achievement, and the findings showed that the viability of consistency is an important variable in career choice. [11].

According to Li, Yao, Chen, and Wang (2012), the relationship between the personality and environmental is positively related. The individual interest and choosing subject major fit is one of the positive result from Li research. The students focus on their personal interest to choose their subject major. The individual interest is shown higher fit than the development needs and the competency of the career [12].

However, there is some research found out that, the interest congruence and career-related satisfaction relationship is inconsistent [13], which mean the effect of the interest congruence is not strong enough to affect the career-related satisfaction. Etzel and Nagy (2015) findings showed that the correlation between P-E fit and personality is weak. The working requirement and and individual's ability is stronger correlation towards satisfaction comparde to the personality and career environment [14].

Pozzebon, Ashton, and Visser (2014) also found that correlation of interest unrelated with academic outcome. The academic satisfaction also has other consideration such as liking of professor or the environment of specific classes [15]. Vocational interests are not the main factor that influences occupational choice. In consideration of career choice, other factors such as abilities, values, education and training requirement, prestige and so on need to be considered [16].

Li, Yao, Chen, and Wang (2012) report that the interest and major fit does not related with the academic satisfaction and academic performance. This is because the interest does not strong enough to change or affect the performance [12]. Individual who fall into the place that is not congruent with their interest will have the chance to develop new interest and skills to get into function in their workspace [2].

One interesting result found in Young, 2016 research. His result was show that the occupational congruence was poor in the IT major satisfaction. The Holland concept of congruent is based

on the stable personality characteristics and stable working characteristic [17]. Therefore, when one side is not stable it would be hard for researcher to found the congruent between the individual and work environment. IT major were the one who have different job characteristics, which based on the changing on technology. The characteristics is flexible due to the rapid change on technology [17].

Other factors affecting career decision-making

Among the factors that affecting career decision is career education. Career education helps individual to develop meaningful career development skills such as self-regulated learning attitudes, goal setting and self-concept. The career development skills help student to increase creativity and academic achievement [7]. It also helps students to have more understanding about themselves, the working environment, and the skills needed.

Other factors that affect the career and educational decision-making are financial stress and parental support. Parental support which included the financial support makes the individual to give up their first choice. Example, Investigative and Realistic personality has university academic programs which are more expensive compare to Social personality. Without financial support or parental supports, individual tends to choose the cheaper programs and focus on the salary for their future career [18].

Gender could also be one of the factor that affecting the career decision. Different gender will have different range of interest. Female are more likely to have Social, Artistic and Investigative personality compared to male. Males are more toward Realistic and Enterprising personality [18]. This difference is due to the effect of pre-collegiate preparation [18]. The information of gender role is been set by the education or adult. Other than that, the involvement of extra-curricular activities in school make male and female students fall into different categories.

Another research show that gender will slightly different in the area of STEM. Male and more likely to enter STEM field as their major. However, the personality of male and female who choose to enter STEM field is very different. Male who are social personality will not choose STEM as their major, while for female who is high score in the social personality will choose to enter STEM field compare to the one who score low in social personality [19].

Culture different is another factor of affecting career decision. According to Yang, Morris, and Protolipac (2018), the social status of occupations in different cultures will contribute to the career choice. For example, Chinese place machinist in fifth place of 24 occupation while western people place machinist in fourteenth [20]. The ranking will affect the individual in expressing their vocational interest. The level of the ranking make the social status different. They will be more effort implied by the individual if the career social status is high [20]. Besides, in Chen and Simpson, (2015), report showed that the Asian Americans are more likely to enroll in the STEM major compare to the other races in America.

Culture in different country also will affect the validity of Holland code. The different country or states with different culture provide different strength of Holland code. Morgan and de Bruin (2017), provide the data from three region in Africa. The result show that the three region have different fit with Holland code. The southern african region was good as the US region, while for the Eastern and Western region show weaker fit on Holland code [21].

Lastly, job lose or live event will influences individual career decision. Job lose or unemployment will change an individual interest [22]. It is because job lose is the key role of one's occupation in development of vocational interest. Individual will motivated to achieve more in their career after losing their

job. Besides, live event will effect on personality train development [22]. The later research also found out that the person who have an injury or disability will facing the vocational limitations and will make it become one of the factor that affecting career choice [16].

LIMITATION/ FUTURE RECOMMENDATIONS

This study is to understand the effectiveness of the Holland theory. However, most of the selected articles are researched conducted in western country or mainly in America. The results may differ on the Asian country. So the result can't represent the view for all the country. The limitation is Holland theory have few main concept. The focus is too wide. For the next study, researcher can narrow down to one of the main concept of Holland theory on the RIASEC job personality.

PRACTICAL IMPLICATION

This review can have positive impact on future Holland theory research and for counsellor training curriculum development. By understanding the different of the client, counsellor could understand more about their client [23].

A career counsellor should understand the benefit of Holland theory which is to help individual or students who are in needs of career and education decision making. Holland theory helps individual in discovering interest and skills exploration [2]. Career counsellor can use Holland theory to help client to gain broader self-awareness and career awareness. By increasing the awareness of the client, counsellor should able to identify the interest of the client and help them link with the future career environment. Career counselling is the service that help individual to broaden their interest and skills. It is an important key transition point for clients or individuals [2].

Besides, career counsellors need to understand that interest is not the only factor that affecting career or decision making. For example, gender may also contributes to the difference of interest [18]. Female are more toward Social personality jobs and male are more in Realistic personality jobs.

Career counsellors who work under multicultural setting need to serve their service out of the comfort zone [24]. Counsellors have to understand the culture differences that may contribute to different view on career choice and career decision. Counsellors need to work with client from different race, ethnic, educational level and socioeconomic to get broader picture on how they perceive and values on certain jobs. Career counsellors need to understand client's personal value, beliefs, and their ecological history. Counsellor need have to practice on reflecting on the areas of discomfort, it will helps counsellor to break their blind spot and break their bias toward the client that is difference background with them [23]. By understanding the background of the client, counsellor will have improving their self-reflection ability and the competence in working with broader range of client.

CONCLUSION

Based on the discussion on above, we can see that Holland theory have close relationship with determine career or education path. It can help individual to understand more about what they need and want in their career. Quite a number of researches had discussed on the PE fit effect of Holland theory and the RIASEC model. The greatest the congruent between the degrees fit of personality and the environment, the higher the satisfaction of the individual in the career or major. Besides, few factor will affect the career and education being discussed. One of the factors is career education. Career education can increase the chance of getting better career and better income in future. It helps individual to get better career development skills that is important for the individual to use in their career life.

Financial stress also one of the factors that caused the changes

in decision making. The low financial support from family causes the individual to avoid the study program that need lot money. Individual in high financial stress, tend to give up their interest and choose the career or the major that will help them to get better status and higher salary.

Other than that, gender and culture difference also affecting the career and education decision making. Different gender has different interest preference. Counsellor also need think creatively to address the problem of culture difference. Counsellor have to understand their own cultural competent when involving in the counselling. Counsellor need to understand and discover the culture of the client and help them to get the preference career.

Overall review is Holland theory is effective on career and education decision making. Most of the research showed that career and education satisfaction is affecting by the interest of the individual where same with the concept propose by Holland. Holland theory help client to discover their interest and personality type and help them to match into the same type of environment.
